Assembler Tutorial

This program is part of the software suite that accompanies

The Elements of Computing Systems

by Noam Nisan and Shimon Schocken

MIT Press

www.nand2tetris.org

This software was developed by students at the Efi Arazi School of Computer Science at IDC

Chief Software Architect: Yaron Ukrainitz

Background

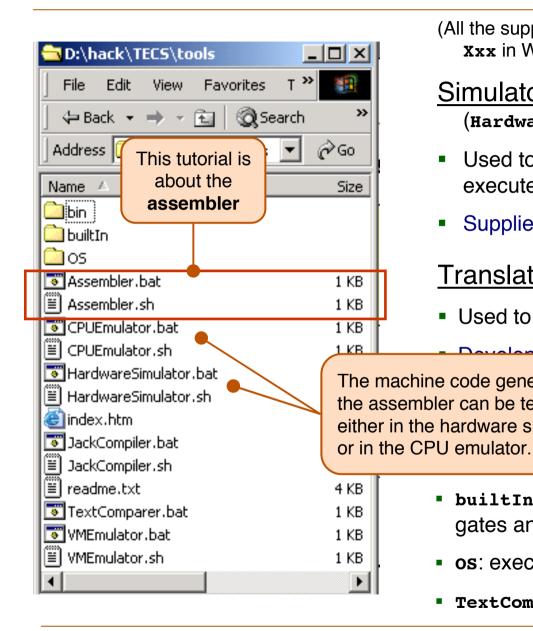

The Elements of Computing Systems evolves around the construction of a complete computer system, done in the framework of a 1- or 2-semester course.

In the first part of the book/course, we build the hardware platform of a simple yet powerful computer, called Hack. In the second part, we build the computer's software hierarchy, consisting of an assembler, a virtual machine, a simple Java-like language called Jack, a compiler for it, and a mini operating system, written in Jack.

The book/course is completely self-contained, requiring only programming as a pre-requisite.

The book's web site includes some 200 test programs, test scripts, and all the software tools necessary for doing all the projects.

The book's software suite

(All the supplied tools are dual-platform: Xxx.bat starts Xxx in Windows, and Xxx.sh starts it in Unix)

Simulators

(HardwareSimulator, CPUEmulator, VMEmulator):

- Used to build hardware platforms and execute programs;
- Supplied by us.

Translators (Assembler, JackCompiler):

Used to translate from high-level to low-level;

ad by the students, using the book's The machine code generated by solutions supplied by us. the assembler can be tested either in the hardware simulator

d translators software;

- builtin: executable versions of all the logic gates and chips mentioned in the book;
- os: executable version of the Jack OS;
- TextComparer: a text comparison utility.

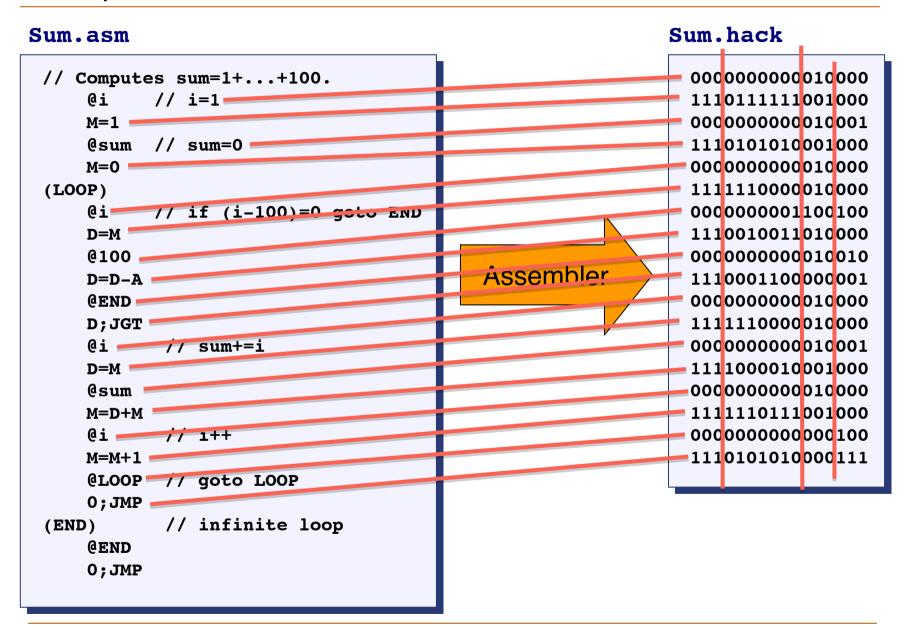

Assembler Tutorial

- I. Assembly program example
- II. Command-level Assembler
- III. Interactive Assembler

Relevant reading: Chapter 4: Machine and Assembly Language

Example

Example

Sum.asm

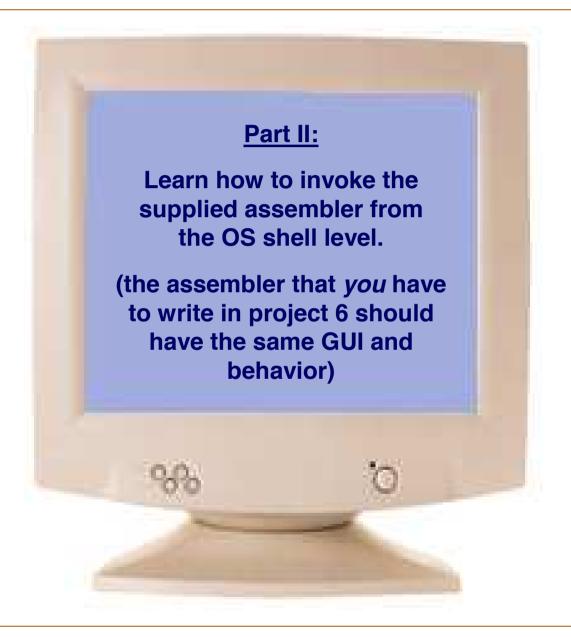

```
// Computes sum=1+...+100.
    @i
          // i=1
    M=1
    @sum // sum=0
    M=0
(LOOP)
    @i
          // if (i-100)=0 goto END
    D=M
    @100
    D=D-A
    @END
    D; JGT
    @i
           // sum+=i
    D=M
    @sum
    M=D+M
    a i
           // i++
    M=M+1
           // goto LOOP
    @LOOP
    0;JMP
           // infinite loop
(END)
    @END
    0;JMP
```

The assembly program:

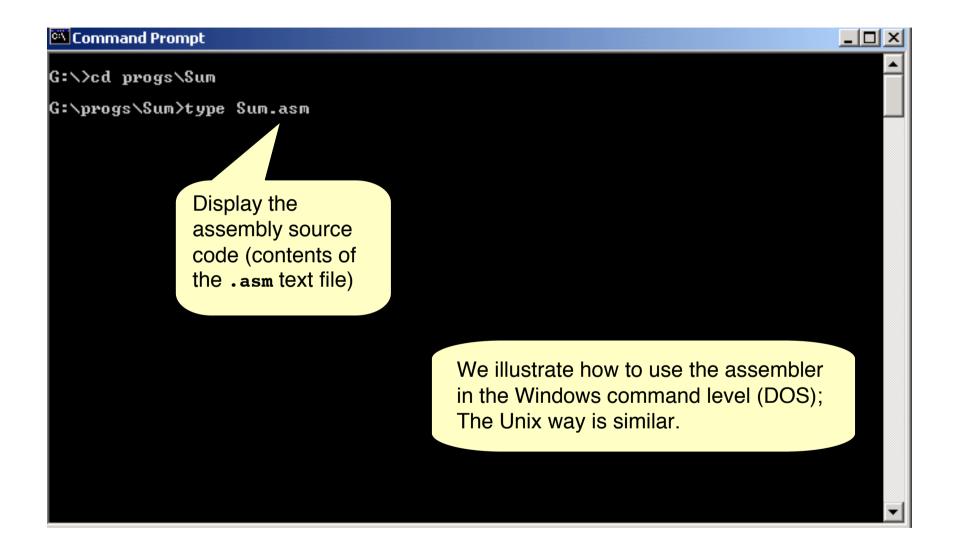

- Stored in a text file named Prog.asm
- Written and edited in a text editor

The assembly process:

- Translates Prog.asm into Prog.hack
- Eliminates comments and white space
- Allocates variables (e.g. i and sum) to memory
- Translates each assembly command into a single 16-bit instruction written in the Hack machine language
- Treats label declarations like (LOOP) and (END) as pseudo commands that generate no code.

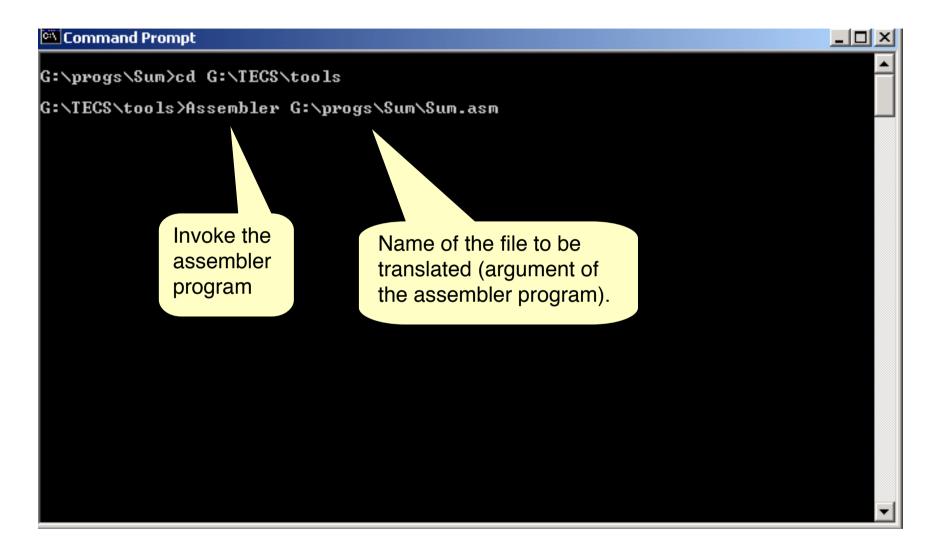

The command-level assembler

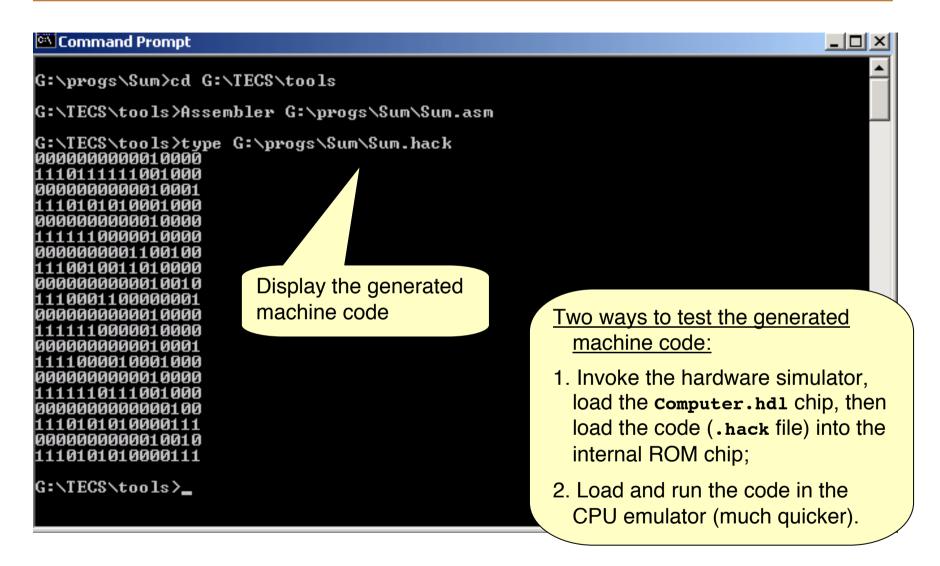

Inspecting the source file

```
Command Prompt
G:\>cd progs\Sum
G:\progs\Sum>type Sum.asm
// Computes sum=1+...+100.
          // i=1
    Ci
    M=1
    @sum // sum=0
(LOOP)
                                                            Source
    0i
          // if (i-100)=0 goto END
    D=M
                                                            code is
    0100
    D=D-A
                                                            shown
    GEND
    D; JGT
           // sum+=i
    @i
    D=M
    esum
    M=D+M
           // i++
    0i
    M=M+1
    CLOOP
           // goto LOOP
    0;JMP
(END)
           // infinite loop
    CEND
    0;JMP
G:\progs\Sum>
```

Using Compare Files

Using Compare Files

Using Compare Files

On weekends, my father would take me for walks in the woods and he'd tell me about interesting things that were going on. "See that bird?" he says. "It's a Spencer Warbler." (I knew he didn't know the real name.) "Well, in Italian, it's Chutto Lapittida. In Portuguese, it's a Bom da Peida. In Chinese, it's a Chung-long-tah, and in Japanese, it's Katano Tekeda. You can know the name of that bird in all the languages of the world, but when you're finished, you'll know absolutely nothing whatever about the bird. You'll only know something about people in different places, and what they call the bird. So let's look at the bird and see what it is doing - that's what counts." This is how I learned very early the difference between knowing the name of something and knowing something.

Richard P. Feynman, The Making of a Scientist, 1988.
